                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        日
                                                                                                                                                                    Matches
                                                                                                                                                                                                                                                      The present invention provides a method for producing a pertussis toxin (also designated lymphocytosis-promoting factor, histamine-sensitising factor and islet activating protein) with a modified biological activity, involving analysing the crystal structure of the protein to identify active sites which can then be modified. This may lead to an alteration in the toxicity, cell binding or enzyme activity of the toxin. This can be used in the production of immunoprotective analogues of pertussis toxin. Pertussis toxin is the cause of whooping cough following infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        22-AUG-1994;

The invention relates to a recombinant AB5B subunit protein comprising at least one mutation, where the mutation alters the number of amino acid residues available for chemical modification as compared to a wild type AB5B subunit protein, and where the recombinant protein retains an effective target ligand binding affinity. A recombinant AB5B subunit protein such as cholera toxin B protein (CTB) can be specifically covalently linked at lysines or cystelnes to an immunogen or vaccine. Recombinant mutant CTB (rCTB) can be used in the treatment of autoimmune diseases e.g. Theumatoid arthritis, encephalomyelitis (or other neuron constitute of a constant and diseases e.g. Theumatoid arthritis, encephalomyelitis (or other neuron constant).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AB5B subunit protein; mutation; recombinant; cholera toxin B; CTB; immunogen; autoimmune disease; neuron demyelinating disease; rCTB; LTB infection; parasitic; immunosuppressive; antiarthitic; antirheumatic; antidiabetic; neuroprotective; vaccine; heat labile toxin B; variant.
                                                       demyelinating diseases) and diabetes. The rCTB or other B subunits invention can also be used to induce tolerance to infection, e.g. parasitic infection. The present sequence represents a variant of t

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a recombinant AB5B subunit protein comprising at least one mutation, where the mutation alters the number of amino acid residues available for chemical modification as compared to a wild type AB5B subunit protein, and where the recombinant protein retains an effective target ligand binding affinity. A recombinant AB5B subunit protein such as cholera toxin B protein (CTB) can be specifically covalently linked at lysines or cysteines to an immunogen or vaccine. Recombinant mutant CTB (rCTB) can be used in the treatment of autoimmune diseases e.g. rheumatoid arthritis, encephalomyelitis (or other neuron demyelinating diseases) and diabetes. The rCTB or other B subunits of the invention can also be used to induce tolerance to infection, e.g. a parasitic infection. The present sequence represents a variant of the E. coll heat labile toxin B (LTB) protein.
                                                                                                                                                                                                                                                                                                                                                                   AB5B subunit protein; mutation; recombinant; choiera toxin B; CTB; immunogen; autoimmune disease; neuron demyelinating disease; rCTB; LTB infection; parasitic; immunosuppressive; antiarthritic; antirheumatic; antidiabetic; neuroprotective; vaccine; heat labile toxin B; variant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Recombinant AB5B subunit protein comprising a mutation that alters the number residues available for chemical modification, useful for covalently linking to an immunogen or vaccine which can be used for

A recombinant AB5B subunit protein such as cholera toxin B protein (CTB) can be specifically covalently linked at lysines or cysteines to an immunogen or vaccine. Recombinant mutant CTB (TCTB) can be used in the treatment of autoimmune diseases e.g. rheumatoid arthritis, encephalomyelitis (or other neuron demyellnating diseases) and diabetes. The TCTB or other B subunits of the invention can also be used to induce tolerance to infection, e.g. parasitic infection. The present sequence represents a variant of the E. coli heat labile toxin B (LTB) protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Recombinant AB5B subunit protein comprising a mutation that alters number residues available for chemical modification, useful for covalently linking to an immunogen or vaccine which can be used for

              The invention relates to a recombinant AB5B subunit protein comprising least one mutation, where the mutation alters the number of amino acid residues available for chemical modification as compared to a will type AB5B subunit protein, and where the recombinant protein retains an effective target ligand binding affinity. A recombinant AB5B subunit protein such as cholera toxin B protein (CTB) can be specifically covalently linked at lysines or cysteines to an immunogen or vaccine. Recombinant mutant CTB (rCTB) can be used in the treatment of autoimmunum and the contraction of the covalence of t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 infection; parasitic; immunosuppressive; antiarthritic; antirheumatic; antidiabetic; neuroprotective; vaccine; heat labile toxin B; variant.

The rCTB or other B subunits of the invention can also be used to induce tolerance to infection, e.g. parasitic infection. The present sequence represents a variant of the E. coli heat labile toxin B (LTB) protein.

                                                                                    The present invention relates to recombinant exotoxin protein variants, which comprise an exotoxin mucosal cell binding motif and a nucleic acid affinity domain. The present sequence is one such protein variant. In the present invention the heart-labile enterotoxin (LT) of Escherichia coli was used as an exotoxin. LT is a member of the ADP-ribosylating exotoxin (bARE) family. The protein variants are useful for selectively delivering nucleic acid to mucosal cells, for inducing an immune response when the nucleic acid encodes an antigen to which the immune response is desired, for selectively delivering a gene to a mucosal cell, and for achieving expression of a protein in a subject, by administering a composition
                                                                                                                                                                                                                                                               Novel exotoxin protein variant useful as protein carrier for facilitating gene delivery, comprises a mucosal cell binding an exotoxin and a nucleic acid affinity domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           demyelinating diseases) and diabetes. The rCTB or other B subunits of invention can also be used to induce tolerance to infection, e.g. parasitic infection. The present sequence represents a variant of the E. coli heat labile toxin B (LTB) protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to recombinant exotoxin protein variants, which comprise an exotoxin mucosal cell binding motif and a nucleic acid affinity domain. The present sequence is one such protein variant. In the present invention the heat-labile enterotoxin (LT) of Escherichia coli was used as an exotoxin. LT is a member of the ADP-ribosylating exotoxin (bARE) family. The protein variants are useful for selectively delivering nucleic acid to mucosal cells, for inducing an immune response when the nucleic acid encodes an antigen to which the immune response is desired, for selectively delivering a gene to a mucosal cell, and for achieving expression of a protein in a subject, by administering a composition
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel exotoxin protein variant useful as protein carrier for facilitating gene delivery, comprises a mucosal cell binding an exotoxin and a nucleic acid affinity domain -

The present sequence is one such protein variant. In the present invention the heat-labile enterotoxin (LT) of Escherichia coli was used as an exotoxin. LT is a member of the ADP-ribosylating exotoxin (DARE) family. The protein variants are useful for selectively delivering nucleic acid to mucosal cells, for inducing an immune response when the nucleic acid encodes an antigen to which the immune response is desired,
                                                                                                                                                                                                                                                                                                                      Unidentified.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel exotoxin protein variant useful as protein carrier for facilitating gene delivery, comprises a mucosal cell binding an exotoxin and a nucleic acid affinity domain -

                                                                                                                                                                                                                                                                          The present invention relates to recombinant exotoxin protein variants, which comprise an exotoxin mucosal cell binding motif and a nucleic acid affinity domain. The present sequence is one such protein variant. In the present invention the heat-labile enterotoxin (LT) of Escherichia coli was used as an exotoxin. LT is a member of the ADP-ribosylating exotoxin (bARE) family. The protein variants are useful for selectively delivering nucleic acid to mucosal cells, for inducing an immune response when the nucleic acid encodes an antigen to which the immune response is desired, for selectively delivering a gene to a mucosal cell, and for achieving expression of a protein in a subject, by administering a composition comprising the protein variant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel exotoxin protein variant useful as protein carrier for facilitating gene delivery, comprises a mucosal cell binding motif of an exotoxin and a nucleic acid affinity domain -

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

genome polyprotein - murine hepatitis virus (strain A59)
N;Alternate names: protein lb
N;Contains: RNA-directed RNA polymerase (EC 2.7.7.48)
C;Species: murine hepatitis virus, MHV
C;Date: 30-Sep-1993 #sequence_revision 30-Sep-1993 #text_change 20-Jun-2000
C;Accession: S15760; S08652
                                                                                         00
                                                                                                                                                                                                                                                                                                                                                          conserved hypothetical protein 263 - Odontella sinensis chloroplast C;Species: chloroplast Odontella sinensis C;Date: 17-Feb-1998 #sequence_revision 26-Feb-1998 #text_change 20-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A;Cross-references: EMBL:x51939; NID:g58974; PID:g1334829 C;Superfamily: infectious bronchitis virus RNA-directed RNA C;Keywords: nucleotidyltransferase; RNA biosynthesis
